

The platform is already built and already running. What we do with you is connect it.

MAKE is the production system our teams use today, on live work. Nothing in this proposal waits for a platform to be finished. The work we do together is connecting it to your DAM, your approvals and your channels.

Built

The platform, its modules and the tasks that run inside it are in daily use on our work. None of it is being written for this pitch.

Connected to you

We integrate with the systems you already run. Your DAM stays your DAM, your approvers stay your approvers, and your channels stay where they are.

Working from your first brief

There is no pilot platform and no parallel build. Your work goes through the same system as the rest of our production.

We make the parts once, then assemble them into everything.

Traditional production builds each asset from scratch. Modular production builds the components once, then recombines them into every format, channel and market that needs them. The saving compounds every time something new is asked for.

Every piece of work takes one of three routes. You always know which one.

At briefing we choose a route for each deliverable. The route decides how much of the production sequence our people run and how much the system runs. It never changes who approves the work.

One approval gate, whichever route the work takes. Nothing is released without your named approver signing it off, including on the automated route. The balance shown above is indicative of the difference between the routes rather than a fixed split.

One layer connects your systems to our production tools.

MAKE sits between the two. Your DAM, your approvals and your channels connect on one side. The tools our teams produce with connect on the other. Tools can be added or swapped without anything else changing, and nothing you already run is replaced.

YOUR SYSTEMS

OUR PRODUCTION TOOLS

The connections on the left are the work we do together at the start. The ones on the right are already in place. That is the whole of the difference between what exists and what we build.

A brief only uses the parts of the system it needs.

MAKE is a set of modules, not one product you switch on whole. A single social cut-down touches two of them. A nine-market campaign touches all of them. There is nothing to implement twice, and nothing for your team to learn about the parts a brief never uses.

Each module handles a different part of production. A module is switched on for a brief or it is not. There is no partial state and no second implementation underneath.

THE MODULE SET

THREE BRIEFS, THREE DIFFERENT SETS

One social cut-down

single market

Full campaign

nine markets, every format

E-commerce refresh

across a product range

☒ switched on ☐ not used for this brief

Complexity is only a problem if you have to absorb all of it. Nobody on your side configures, licenses or learns the modules a brief does not touch.

The system works across the whole of production, not only the making.

Work runs through three stages, and specific tasks are switched on at each one. This is what answers what happens before production, during it, and after it.

People are in the loop at the points that matter. Your team reviews before production begins and approves before anything is released. Everything between those two points is ours to run.

Integrating your DAM is what stops the same asset being made twice.

Your library already holds a great deal of what the next brief needs, but today nothing asks it before production starts. Integrating it turns your DAM from a store of finished files into your brand’s intelligence layer: a live record of what exists, what each asset is made of and where it has been used.

TODAY: YOUR LIBRARY IS WHERE WORK ENDS UP

ONCE IT IS INTEGRATED: YOUR LIBRARY IS WHERE WORK STARTS

Without the integration, your DAM is a record of what you have already paid for. With it, it is the single source of truth that decides what you need to pay for next. That is the difference between a library you store in and one you produce from.

Your DAM stays the source of truth. Everything we make comes back to it.

Assets and information come out of your DAM. Production happens in MAKE. What returns is the finished work, the reusable components behind it, and a record of what was made for which market. Your library is more complete after every brief than it was before.

MAKE never becomes your system of record. It is where work is produced, not where it lives. Your DAM is complete at every point in this loop.

Your second market orders what already exists. It does not brief again.

Because every brief leaves its components and a record behind, the next market can search, find and order. Language, format and local claims become choices on a form rather than a new brief, a new schedule and a new cost.

INSTEAD OF THIS

A second brief, a second concept, a second shoot, a second review.

The whole chain on page 07 run again, at close to full cost and full timeline, to produce something that is a near neighbour of an asset already sitting in your DAM.

THIS HAPPENS INSTEAD

Nobody writes a creative brief. Nobody schedules a shoot. And nobody in the second market needs to know the first market’s production history to place the order. What can be ordered is exactly what the record says already exists.

Getting started does not depend on tidying your archive first.

Everything produced from day one is fully described and ready to reorder immediately. For material already in your DAM, we describe it at the point it is first reused, so there is no cataloguing project to finish before the benefit starts.

EVERYTHING IN YOUR DAM

Nothing to do before we start

Your first briefs run from day one. They do not wait on the state of the archive, and they do not depend on it.

Described when it is used

The first time a piece of existing material is reused, we describe it properly, once. From that point it behaves like anything else in the system.

Prioritised only where it pays

If part of your library has obvious demand, we can prepare it ahead of time. We will agree that with you in discovery rather than assume it.

You raised this in the last round, and it is a fair challenge. The answer is that the value does not sit behind a back-catalogue project. It starts with your first brief and the archive catches up behind it.

What runs from day one, what we connect, and where it goes next.

Three states, and nothing listed that does not exist. There are no dates on this page: timings belong in the plan rather than in a technology section.

RUNNING TODAY
In daily use on our work, before this engagement

WHAT WE CONNECT WITH YOU
Scoped together at the start. This is the whole of the new work.

Your DAM, in and out
see page 07

Your metadata, mapped to components

Your review and approval process

Your channels and e-commerce feeds

Your approach to the existing library
see page 10

Connection work, not construction work.

WHERE IT GOES NEXT
Direction of travel, at theme level

The platform keeps developing, and you get the benefit of that without a migration or a new agreement. We share the roadmap at theme level rather than committing to features in a pitch.

THEMES IN VIEW
Post-production compositing

Further themes to be completed

No dates and no feature commitments on this page.

The middle column is the only new work in this proposal. The left column exists already. The right column is direction, not a promise.

You choose two scenarios, and we run them live.

Not a recording and not a mock-up. On the day you pick two from the scenarios we bring, and we run them in the actual system, from brief through to finished output.

The point of the live session is that nothing on the previous eleven pages needs taking on trust.

What we show you on the day is the platform running now, not a build of it. The one thing this section describes as new work is the connection to your systems, and that is scoped on page 11. If there is a scenario you would rather see than the ones we bring, tell us beforehand and we will prepare it.
