

MAKE is not a platform we build for you. It is running now.

The only new work is connecting it to your stack.

Last round the technology read as complex, unbuilt, slow to pay back, and heavy on your team. This section answers those four concerns in order, and it flags openly what we have not yet resolved.

THE FOUR CONCERNS FROM THE LAST ROUND, AND WHERE EACH ONE IS ANSWERED

THEY SAID “It feels too complex.” Too many parts to understand or adopt. ANSWERED ON 060708	THEY SAID “It still needs building.” It reads as a platform project, not a service. ANSWERED ON 040512	THEY SAID “Benefit is too far away.” Payback sits beyond the horizon they care about. ANSWERED ON 021013	THEY SAID “That is a lot of effort for us.” Named directly: reverse engineering the DAM. ANSWERED ON 091113
--	---	---	--

HOW TO READ EVERY DIAGRAM IN THIS SECTION

EXISTS TODAY Built and in use on our work now	INTEGRATION WORK Connecting MAKE to your stack	ROADMAP THEME Direction only. No dates in this deck.	OPEN, WE OWE AN ANSWER Unresolved. Flagged, never hidden.	YOURS Your DAM, your tools, your team
---	--	--	---	---

Efficiency does not come from making each asset faster. It comes from making components once and recombining them.

One illustrative example runs through this deck: a seasonal skincare launch film, briefed once. It is an example chosen to explain the mechanism, not a description of your brief.

A · ONE BRIEF

ILLUSTRATIVE BRIEF

Seasonal launch film

One shoot. One edit. One set of approvals.

Only component A's routing is drawn in full, so the diagram stays readable. Every other component fans out the same way, shown faintly. The letters inside each output are the full recipe.

THE ARITHMETIC

26 component slots filled across 6 outputs. 9 components actually produced.

The distance between those two numbers is where the efficiency lives, and it widens every time an output, a market or a format is added.

OPEN

The 80% figure. It was referenced as the goal but never defined. 80% of what, measured how, against which baseline: share of assets produced modularly, hours saved, or cost saved?

Until that is agreed we show the mechanism here and put no number on it. **Needed from: the commercial lead, before submission.**

Assisted, augmented and automated are three routes through one system, chosen per deliverable at triage.

They are not three stages of production, and they are not a human versus machine split. What changes between them is how much of the sequence AI tasks carry. What never changes is the approval gate.

OPEN The three definitions are missing from this conversation. Each route needs one agreed sentence and a qualifying rule for when it is used. Without those, this slide is a shape without content, and the client cannot tell which route their work lands in.
Needed from: whoever holds the brief response. Highest priority open item in this section.

WHY THIS REPLACES THE EARLIER VISUAL

The earlier “human plus tech / fully automated” diagram described the **production step only**. It left out briefing and triage, so it read as a split between people and machines rather than three routes. Routes run brief to delivery. Versioning and translation sit inside the automated route, not outside the model.

**MAKE is the orchestration layer our teams already use.
Proprietary core, open edges.**

Read the outlines. Solid means built and running on our work today. Dashed means integration. Everything new in this proposal is on the left of this diagram, and it is connection work, not platform work.

THE POINT OF THIS SLIDE

The middleware is the answer to “it needs building”. The orchestration layer is built. Tools plug into it and can be swapped without rebuilding anything. Nothing in this proposal asks you to replace a tool you already run, and nothing waits on a platform being finished.

OPEN

OPEN **Tool names are deliberately absent.** The split between the creation tool and the aggregating tool for the live demonstration has not been confirmed, and what was shown in preparation was not the tool intended for the pitch.

Until the demo lead confirms, naming tools here risks contradicting the live session. **Needed before: the live rehearsal.**

One connected space is our efficiency. This is how it turns into yours.

We orchestrate because production spread across disconnected tools is slow, and slow is expensive. The time we get back is the time you get back, and the visibility is a side effect you can use.

WITHOUT AN ORCHESTRATION LAYER

Every crossing is a hand-off, and every hand-off is a re-export, a re-brief, a version that drifts, an approval chased by email, or an asset nobody can find. None of that work appears on any invoice line, and all of it costs time.

THROUGH MAKE · ONE CONNECTED SPACE

MAKE is not your system of record. Your DAM is. This rail is where work is produced, not where it lives. See slide 09.

OUR INTERNAL EFFICIENCY → YOUR BENEFIT

WE GET

Fewer hand-offs between tools

YOU GET

Shorter time from brief to first cut

fewer places for a deliverable to sit still

WE GET

One record of versions, review and approval

YOU GET

Status you can see without asking for it

no status calls to find out where something is

WE GET

Open connectors instead of one closed suite

YOU GET

Your tools and your DAM stay where they are

no migration, no replacement, no new licences for you

A brief uses the modules it needs. Not every brief uses every module.

MAKE is a set of modules, not one product you switch on whole. The same platform serves a single-asset request and a nine-market campaign, with nothing to re-implement in between.

Every module answers the same four questions. This is the level of detail the written submission needs.

Last round this was simplified until the argument stopped landing. A written submission has no presenter in the room, so each module gets explained rather than named.

WORKED EXAMPLE · THE ONE MODULE THE DISCUSSION NAMES

One connected space

EXISTS TODAY

WHAT IT IS

The single place a brief, its components, its versions and its approvals live while the work is being produced.

WHAT IT DOES

Holds every version in sequence, carries review state with it, and releases only what an approver has signed.

v1

v2

v3

⧑

approver

Released

one record, one place, for the life of the deliverable

WHY YOU CARE

You can see where anything is without asking, and nothing is rebuilt because a version went missing.

CONNECTS TO

Your DAM

This module

Your review and approval

Your DAM on one side, your approvers on the other. It replaces neither.

same structure, one card each

WHAT IT IS

WHAT IT DOES

WHY YOU CARE

CONNECTS TO

OPEN The content of the remaining cards. Each needs the four answers above plus a drawn mechanism, not a name in a box. Source material is the five-step module set in our current deck; the existing product playbook was checked in the discussion and is out of date, so it cannot be the source. **Owner and deadline needed: this is the single largest writing job in the technology section.**

TECHNOLOGY SECTION · STORYBOARD FOR NARRATIVE AGREEMENT

07 / 15

AI tasks are the working parts. They sit at named points across pre-production, production and post.

This is the slide that answers what actually happens before, during and after production. One term throughout: **AI tasks**. “Makers” is internal shorthand and does not appear in anything the client sees.

TWO DECISIONS ALREADY TAKEN

In the written submission: one slide showing the whole AI task set, because that is what answers their question about pre, mid and post.
Not in the written submission: a separate AI task diagram per scenario. That was considered and ruled out. It belongs in the live session only.

OPEN

The task inventory itself. A list of tasks exists with the demonstration lead and was referred to in the discussion, but it has not been supplied. Every amber slot on this slide is waiting on it.

Three named capabilities are placed above. **Needed: the full list, plus which zone each task belongs to, and which are live versus roadmap.**

Your DAM stays the source of truth. MAKE produces around it and hands everything back.

This is the answer to integration, data and portability. Assets and intelligence come out of your DAM, production happens in MAKE, and what returns is richer than what left.

THE LINE WE DO NOT CROSS

MAKE never becomes your system of record. It is where work is produced, not where it lives. Your DAM is complete at every point in this loop, and it is more complete after each brief than before it.

OPEN

Portability is one of the three things this section has to answer, alongside integration and data. This loop is the shape of the answer, but the actual commitment is not written: what you keep, in what formats, and what happens to the production record if the relationship ends.

Needed: one paragraph, agreed with legal, before submission.

A second market orders from what already exists. It does not re-brief.

Same example, carried forward. Market one produced the seasonal launch film. Market two wants it in their language, in their formats, with their legal line and their promotion.

THE PATH WE REMOVE

A duplicate of work already done, at close to full cost and close to full timeline, producing something that is a near neighbour of an asset already sitting in the DAM.

THE PATH THAT REPLACES IT · ORDERING

THE POINT

The order is a form, not a brief. What can be ordered is exactly what the production record says already exists. Nobody writes a creative brief, nobody schedules a shoot, and nobody has to know the first market's production history to place the order.

DEPENDENCY

This works from day one for everything produced in the system. It does not work, on its own, for the assets already sitting in your DAM from before the engagement, because those have no production record and no component breakdown. That gap is the next slide, and it is the single largest open item in this section.

Your back catalogue is the real dependency, and we do not yet have a technical answer for it.

You raised this directly last round: the effort of going back through historic assets that were never catalogued properly. It is a fair challenge, it cannot be handed to a discovery workshop, and this is the honest position today.

YOUR DAM TODAY · HISTORIC BACK CATALOGUE

Not orderable as it stands.

no component breakdown
finished files only

metadata partial, inconsistent or absent

What is missing

component breakdown **absent**

usage rights recorded **inconsistent**

market and campaign tagged **inconsistent**

format variants linked **absent**

PRODUCED IN-SYSTEM FROM DAY ONE

Orderable from the moment it is made.

full component
breakdown

production record complete, every field

grows with every brief, from day one

THREE CANDIDATE RESPONSES · NONE OF THESE IS AGREED, COSTED OR COMMITTED

A Automated enrichment at ingest

AI tasks read the existing files and write back component breakdowns, tags and usage records.

Your effort: low. Our exposure: high.

Not established. Nobody in the discussion could confirm this is technically possible at the quality needed. Do not present it as available.

B A dedicated curation resource

A named person assigned to organise, describe and maintain the back catalogue.

Your effort: low. Your cost: a line item.

Not included. Offered on a previous pitch as a chargeable resource. If we propose it here, somebody has to cost it first.

C Enrich on demand

Nothing is touched until an asset is actually ordered. It is described at the point of reuse, once.

Your effort: none up front. Coverage: slow.

Not discussed. Included here because it is the only option that needs neither a technical proof nor a new cost line.

DECISION NEEDED BEFORE SUBMISSION We owe a technical response, and it has to be ours. Whichever option we choose, saying “we will work that out in discovery” repeats the answer that already did not land. Pick one, say what it costs them, and say what we will prove before contract.

What is running, what we connect, and where it is heading.

Same legend as every other slide in this section. The roadmap is at theme level, not feature level: no dates, no percentages, and no list of things that do not exist yet.

Theme 4
TBC

OPEN Only one theme came out of the discussion. Needed from: the product roadmap owner.

AND THE DIRECTION THE WHOLE THING MOVES IN

Your effort is front-loaded and then falls away. Ours rises as more AI tasks come online.

Directional only. Both axes are deliberately unnumbered. Nothing on this slide is quantified, and nothing will be until the efficiency target is defined.

WHY THIS SLIDE IS UNNUMBERED

A number on either axis would be the most quotable thing in the whole section, and the most damaging one if we cannot stand behind it.
The shape is defensible today. The numbers are not.

OPEN

The 80% target belongs on this chart, and it is the thing that would turn a shape into a commitment. It cannot go on until it is defined: 80% of what, by when, measured how, against which baseline.

Same open item as slide 02. **One answer unlocks both slides.**

The written submission carries the whole argument.

The live session adds proof, not new story.

Two tracks. One is what they read with nobody in the room to explain it. The other is what happens on the day, where the demonstration lead runs the chosen scenarios in the live technology.

TRACK A · WRITTEN SUBMISSION · SLIDES 01 TO 13 OF THIS SECTION

01 objection	02 modularity	03 routes	04 MAKE today	05 orchestration	06 modules	07 module detail	08 AI tasks	09 your DAM	10 ordering	11 back catalogue	12 today / next	13 effort
-----------------	------------------	--------------	------------------	---------------------	---------------	---------------------	----------------	----------------	----------------	----------------------	--------------------	--------------

WHAT THE TECHNOLOGY SECTION HAS TO ANSWER, AND WHERE IT IS ANSWERED

- ☒ Integration, data and portability

0409
- ☒ All the tools from brief through to delivery

03040508
- ☒ Tracking what has already been executed, so second-market demand is ordered, not re-briefed

0910

IN THE WRITTEN SUBMISSION

One slide showing the whole AI task set, because that is what answers their question about pre, mid and post production.

NOT IN THE WRITTEN SUBMISSION

A separate AI task diagram per scenario. Considered and ruled out. Live session only.

TRACK B · THE LIVE SESSION

Pick two. We will run them live, in the actual technology.

Scenario names, screenshots and clips have not been supplied, so every card below is a labelled storyboard slot. Nothing on this slide is invented, and the card count is a placeholder until the scenario list is confirmed.
